

Tensional Cosmology (Applied Version)

Chapter 1: Social Structures as Tension Fields

Society is built upon individual tension. Institutions like companies, nations, families, and schools are maintained by the tension of individual roles. When this tension becomes imbalanced, excessive, or vanishes, structural collapse occurs.

Chapter 2: Tension in Economic Systems

Capitalist economics is a tension system that flows capital toward high-APR (Annual Percentage Rate) structures. As capital is drawn toward efficient structures, it ceases to reach peripheral areas. Economic disparity and corporate-state fusion stem from this extreme imbalance in tension.

Chapter 3: Tensional Ethics and the Structure of Responsibility

Ethics is the visualization and balancing of hidden tension. Ethical failure arises when structural tension is invisible. Responsibility is the conscious act of maintaining and regulating output structures by perceiving their internal tension.

Chapter 4: Tensional Propulsion Theory

Tension, as a directional force, can potentially be used for movement by employing tension cancellation and repulsion mechanisms. This enables movement without propellants—via deformation of the internal tension field—allowing precise control superior to conventional gravitational wave theories.

Chapter 5: Consciousness and Existential Tension

Phenomena such as emotion, memory, and will are all forms of tension. Anger is a sharp fluctuation, sadness a decay, and joy an amplification of resonance. The self is an entity capable of autonomously regulating and connecting tensions.

Chapter 6: The Future Society as a Tensional Architecture

Future society must be designed not by capital but by distributed tension. DAOs represent dynamic balance through distributed tension. Basic Income (BI) functions as the provision of initial tension equally. Tensional Cosmology offers a framework to reconstruct ethics, society, and structural thinking.
