

ThoughtMap v0.1

ThoughtMap is an experimental project that visualizes thought patterns hidden within song lyrics.

Originally created from a dataset of 992 self-written songs, the project explores whether lyrics can be used to understand how a person thinks, what themes they repeatedly return to, and how their worldview evolves over time.

Core Concept

Instead of classifying songs by traditional genres such as love, rock, pop, or jazz, ThoughtMap analyzes lyrics based on recurring patterns of thought.

Examples include:

- Society
- Cognition
- Experimentation
- Causality
- Introspection
- Philosophy
- Technology

The goal is not to classify music, but to map the structure of thought itself.

Current Features

1. Lyric Embedding

Converts lyrics into vector representations using language embeddings.

2. Similarity Search

Find songs that are semantically close to a given lyric or idea.

3. Thought Clustering

Groups songs into recurring philosophical and thematic domains.

4. Thought Continent Visualization

Displays songs and cluster centers on a shared semantic map.

5. Civilization Profile

Aggregates clusters into higher-level "civilizations" and calculates their distribution.

6. Thought Search Engine

Search for ideas such as:

- Algorithm criticism
- Subjectivity
- Failure
- Community dependency
- Capitalism criticism

and discover related works.

Future Roadmap

Planned features include:

- Multi-author comparison
- Similar thinker discovery
- Automatic cluster naming using AI

- New song diagnosis
 - Timeline analysis
 - Web application
 - Public search engine
-

Long-Term Vision

ThoughtMap aims to become a search engine for ideas.

Users will be able to:

- Upload lyrics or writing
- Discover their own thought profile
- Compare themselves with other creators
- Find people with similar thinking patterns
- Explore niche and common themes

The project treats creative works not only as art, but also as traces of cognition.
